Logistic regression Wikipedia

December 9th, 2018 - Logistic regression is a statistical model used in predictive modeling. It is a type of generalized linear model. It is used to model the probability of a certain class or event occurring, especially with only two possible classes. The most common application is binary classification, such as predicting whether an email is spam or not, or whether a patient has a disease. It is also used in multi-class classification, such as predicting the class of a handwritten digit. The model is trained using a set of data, and the resulting model can be used to predict the class of new data points. The model is trained using a set of data, and the resulting model can be used to predict the class of new data points.
