X-ray diffraction is a technique used for determining the atomic and molecular structure of a crystal in which the crystalline structure causes a beam of X-rays to diffract into various directions. This phenomenon is the result of the constructive interference of the waves that are reflected from the atoms in the crystal. The diffraction pattern is a function of the wavelength of the X-rays and the structure of the crystal. The diffraction pattern is used to determine the structure of the crystal. The diffraction pattern is a function of the wavelength of the X-rays and the structure of the crystal. The diffraction pattern is used to determine the structure of the crystal.
